INVESTOR IN PEOPLE

The Patent Office
Concept House
Cardiff Road
Newport
South Wales
NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation and Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that the attached document is a printed office copy of the specification in respect of which the patent was granted on the application identified therein.

I also certify that subject to the payment of the prescribed renewal fees, the patent will remain in force for a period of twenty years from the date of the filing of the application.

I further certify that attached hereto is a true copy of the entries made to date in the Register of Patents in respect of the patent which is in force.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has been re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or the inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-Registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 08459 500505.*
- Write your answers in capital letters using black ink or you may type them.*
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.*
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.*
- Once you have filled in the form you must remember to sign and date it.*
- For details of the fee and ways to pay please contact the Patent Office.*

PATENTS ACT 1977

P17594GB-SJP/jsd

5 DESCRIPTION OF INVENTION

"IMPROVEMENTS IN OR RELATING TO A STEERING WHEEL"

10

THE PRESENT INVENTION relates to a steering wheel, and more particularly relates to a steering wheel for a motor vehicle such as a motor car.

15 In many countries, during at least the summer months of the year, the steering wheel of a car parked outdoors may become extremely hot. A hot steering wheel is difficult to hold, and it is therefore dangerous for a person to drive whilst the steering wheel of a car is hot, because proper handling of the steering wheel will be adversely effected. A corresponding problem may be found in cold climates where it can be dangerous to drive a motor car with a
20 very cold steering wheel.

25 It can take rather a long time for the temperature of a steering wheel to be changed substantially by use of the heating or air-conditioning system normally provided within a motor vehicle. It has therefore been proposed previously to provide steering wheels with electric heating wires, so that these may be used to heat a cold steering wheel. However, this type of arrangement cannot be used satisfactorily to cool a hot steering wheel resulting from the motor vehicle being parked for a long period of time in bright sunshine.

The present invention therefore seeks to provide an improved steering wheel.

5 Accordingly, the present invention provides a steering wheel having a central hub connected by at least one spoke to a rim, and at least one heat pipe, the or each said heat pipe being thermally isolated from any external cooling arrangement and being configured to transfer heat from a first region of the rim to another region of the rim solely under its own function.

10 Preferably the rim comprises a single heat pipe extending around substantially the entire extent of the rim.

15 Advantageously the heat pipe has a substantially circular configuration.

 Alternatively the rim comprises two heat pipes, each said heat pipe extending around approximately half of the extent of the rim.

20 Preferably each said heat pipe has a substantially semi-circular configuration.

 Advantageously the two heat pipes are thermally connected to one another.

25 Conveniently the or each heat pipe is provided with or connected to a heater.

 Preferably the or each heat pipe comprises a heating element.

Advantageously the steering wheel has heat pipes located only in the rim.

5 So that the invention may be more readily understood, and so that further feature thereof may be appreciated, embodiments of the invention will now be described, by way of example, with reference to the accompanying drawings, in which:

10 FIGURE 1 is a schematic illustration showing the steering wheel of a motor vehicle being subjected to the heating effect of sunshine;

FIGURE 2 is a schematic illustration of a heat pipe for use in the present invention;

15

FIGURE 3 illustrates the insertion of the heat pipe of Figure 2 into a tube for forming part of the rim of a steering wheel;

20 FIGURE 4 illustrates a completed steering wheel in accordance with a first embodiment of the present invention;

FIGURE 5 illustrates a completed steering wheel in accordance with another embodiment of the present invention; and

25

FIGURE 6 is a view corresponding generally to that of Figure 4, but illustrating the steering wheel being provided with a heating element running through the rim.

It is to be appreciated that in the present invention, use is made of "heat pipes". Heat pipes have been proposed previously and take the form of elongate pipes which can be used to facilitate the rapid transfer of heat. A typical heat pipe comprises an elongate tube formed of metal such as aluminium or copper. The interior of the tube contains an elongate wick which extends from one end of the tube to the other. The wick may be mounted on the inner wall of the pipe. The pipe contains a quantity of volatile fluid such as water, acetone, ethanol or methanol. The pipe is maintained with an internal pressure which is substantially below atmospheric pressure. If one region, for example one end region, of the pipe is heated, then liquid within the pipe will vaporise within that region and will then move, in the gaseous phase, towards the other end of the pipe. As the vapour becomes cooled, the vapour will condense. The vapour will then again turn into liquid, and the liquid will be transported by gravity and/or by a wicking action provided by the wick, back towards the heated region of the pipe. It is to be appreciated that heat will be absorbed, due to the latent heat of vaporisation, at the heated region of the pipe, and heat will be emitted, due to the reclamation of the heat of vaporisation as the vapour condenses, at the point in the heat pipe at which the vapour condenses. Heat can be very quickly transported from one region of heat pipe to another with very little loss of heat during transport. Heat pipes of this type have been proposed previously and are known to the man skilled in the art.

Referring now to Figure 1, there is illustrated, in schematic form, the steering wheel 1 of a motor vehicle 2. The motor vehicle 2 is shown in a parked condition in which it is being subjected to bright sunshine. It will therefore be appreciated that the radiant energy of the sunshine (indicated schematically at 3), may be directed through the windscreen or windshield 4 of the motor vehicle 2, such that it will heat the upper-most region 5 of the steering wheel 1. As will be clear from Figure 1, the lower region 6 of the

steering wheel 1 is shielded from direct heating by the sunshine 3 by other regions of the steering wheel and/or parts of the steering column 7 and dashboard 8 of the motor vehicle. The resultant effect of the situation illustrated in Figure 1 on a conventional steering wheel is therefore that the upper region 5 of the steering wheel can become raised to a very high temperature by the sun, whilst the lower region 6 of a steering wheel remains at a more comfortable temperature for a person handling the steering wheel. It is therefore desirable to seek to reduce the temperature of the upper region 5 of the steering wheel, towards that of the lower region 6 of the steering wheel.

Figure 2 illustrates a substantially straight heat pipe 9 suitable for use in a steering wheel according to the present invention. The heat pipe 9 comprises an initially straight length of tubing 10, which preferably is a length of copper tubing having good levels of thermal conductivity. The copper tubing 10 is provided inside with a wick structure 11, and a small volume of volatile fluid such as water, acetone, ethanol or methanol. However, for use in the present invention, it is preferred to use water within the copper tubing 10. The wick 11 preferably runs substantially the entire length of the copper tubing 10 and can, as is conventional, be mounted on the inner wall of the copper tube 10. The copper tube 10 is evacuated so as to have an internal pressure substantially below atmospheric pressure, and the two ends of the tube 10 are sealed, to maintain these internal pressure conditions.

Figure 3 illustrates the copper tubing 10 of the heat pipe 9 being inserted axially into another length of tubing 12 which has a slightly greater diameter than the copper tubing 10. The length of tubing 12 preferably takes the form of a length of steel or aluminium tubing. Steel or aluminium is preferred because these materials are substantially more rigid than copper and are therefore more suitable to form the outer rim of a motor vehicle steering wheel.

When the heat pipe 9 has been fully inserted into the length of tubing 12, the resulting structure is then heated in an oven in order to connect the two lengths of tubing 10, 12 together. When the two lengths of tubing 10, 12 are heated together in this way, the copper tubing 10 expands to a greater degree than the outer steel or aluminium tubing 12, and so therefore the outer surface of the copper tubing 10 will be urged intimately against the inner surface of the steel or aluminium tubing 12. Heating in this way is continued until the copper tubing 10 and/or the steel or aluminium tubing 12 is mechanically deformed such that the two lengths of tubing become connected to one another. The mechanical connection between the two lengths of tubing 10, 12 in this way can be improved if the outer surface of the copper tubing 10 is scratched or otherwise abraded prior to the heating step.

After the two lengths of tubing 10, 12 have been connected to one another as described above, the resulting length of pipe is then bent so as to define an appropriate shape for the rim of a steering wheel. For example, as illustrated in Figure 4, the co-axial and interconnected lengths of tubing 10, 12 have been bent into a substantially circular configuration to define a substantially circular rim 13 to the steering wheel. The two ends of the outer steel or aluminium tubing 12 have been connected to one another in the lowermost region 6 of the steering wheel, such that the two ends of the heat pipe 9 defined by the copper tubing 10 are located substantially adjacent one another in the lower region 6 of the steering wheel. When the coaxial lengths of tubing 10, 12 have been deformed as described above so as to define the rim 13 of the steering wheel, the resulting rim 13 is then connected, for example by crimping, welding or other convenient fastening method, to die-casted spokes 14 of the steering wheel, the spokes 14 extending from the rim 13 to a

central hub 15. It is preferred for the structure of the spokes 14 and the hub 15 to comprise principally aluminium or magnesium material.

5 A soft resilient layer of plastic or foam 16 is then provided over the rim 13 and parts of the spokes 14, the plastic or foam being selected so as to have a relatively high level of thermal conductivity. Finally, to provide a tactile and aesthetically pleasing outer covering to the steering wheel, a leather or plastic sheet is applied to the outside of the plastic or foam 16.

10 It should therefore be appreciated that the above-described steering wheel structure illustrated in Figure 4 is such that the heat pipe 9 is provided within the peripheral rim 13 of the steering wheel, but that the heat pipe 9 is completely self-contained in a sense that it is thermally isolated from any external cooling arrangement such as, for example, a heat exchanger which has
15 been proposed previously in prior art arrangements. The heat pipe 9 will therefore be understood to be configured to transfer heat from the upper region 5 of the steering wheel towards the lower region 6 of a steering wheel in the event that the upper region 5 becomes heated above the temperature of the lower region 6, for example as a result of radiant energy from the sun. Any
20 liquid within the heat pipe 9 in the upper region of the steering wheel 5 will vaporise upon heating the upper region of a steering wheel 5 and so will move, in a gaseous phase, towards the two ends of the heat pipe 9 which are both located in the lower region 6 of a steering wheel. The liquid vapour thus becomes cooled in the lower region 6 of a steering wheel and so condenses
25 back into a liquid phase. The liquid is then transported by the wicking action of the wick provided in the heat pipe 9, back up to the heated region 5 of the steering wheel. The effect of this is that the upper region 5 of the steering wheel becomes cooled and the heat resulting from the exposure of a steering wheel to the sunshine is spread more evenly throughout the rim 13 of the

steering wheel. It has been found in tests that in conditions in which the upper region of a conventional steering wheel rim reached 90°C , the above-described arrangement of the present invention only reached a temperature of approximately 70° in the upper region of a steering wheel, which is much safer
5 for a person driving a motor vehicle to touch.

Whilst the present invention has been described above with reference to a particular embodiment, it should be appreciated that certain modifications and variations can be made, without departing from the scope of the present
10 invention. For example, Figure 5 illustrates another possible embodiment of the present invention, in which the rim 13 of the steering wheel is provided with two substantially semi-circular heat pipes 9A, 9B, both of which are provided within the outer aluminium or steel tubing 12. One of the heat
15 pipes 9A extends from a position located in the upper region 5 of the steering wheel to a position located in the lower region 6 of a steering wheel, and lies to the right-hand side of the steering wheel as illustrated. The other heat pipe 9B similarly extends from the upper region 5 of the steering wheel to the lower
20 region 6 of the steering wheel, but extends around the left-hand part of the rim 13. Each of these heat pipes 9A, 9B serves the same function as the single heat pipe 9 of the previously described embodiment illustrated in Figure 4. The two heat pipes 9A, 9B can be thermally connected to one another at their
25 respective ends and could, in an alternate configuration, be configured such that one of the heat pipes extends around the upper half of the rim 13, with the other heat pipe extending around the lower part of the rim 13.

Figure 6 illustrates another possible embodiment of the present invention, in which the arrangement described above and illustrated in Figure 4 is provided with an external heat source. In this arrangement, a length of heating wire or element 17 is provided within the heat pipe 9, and extends

throughout substantially the entire extent of the heat pipe 9, following a tortuous path, and being electrically connected to a heating control unit 18, which may be located within the hub 15 of a steering wheel, but could also be located elsewhere within the motor vehicle. The heating wire 17, when energised by the control unit 18 serves to heat the rim 13 of the steering wheel. In such an arrangement, cooling of the steering wheel (with the heater switched off) in the event that the upper part of the steering wheel becomes excessively heated in sunshine, is effected through the sole operation of the heat pipe 9 in the manner described above. However, in cold conditions, the external heat source can be switched on in order to heat the rim of the steering wheel.

It should be appreciated that in each of the above-described arrangements, the steering wheel is only provided with heat pipes within its rim 13.

In the present Specification "comprises" means "includes or consists of" and "comprising" means "including or consisting of".

The features disclosed in the foregoing description, or the following Claims, or the accompanying drawings, expressed in their specific forms or in terms of a means for performing the disclosed function, or a method or process for attaining the disclosed result, as appropriate, may, separately, or in any combination of such features, be utilised for realising the invention in diverse forms thereof.

CLAIMS:

- 5 1. A steering wheel having a central hub connected by at least one spoke to a rim, and at least one heat pipe, the or each said heat pipe being thermally isolated from any external cooling arrangement and being configured to transfer heat from a first region of the rim to another region of the rim solely under its own function.
- 10 2. A steering wheel according to Claim 1, wherein the rim comprises a single heat pipe extending around substantially the entire extent of the rim.
- 15 3. A steering wheel according to Claim 2, wherein the heat pipe has a substantially circular configuration.
- 20 4. A steering wheel according to Claim 1, wherein the rim comprises two heat pipes, each said heat pipe extending around approximately half of the extent of the rim.
- 25 5. A steering wheel according to Claim 4, wherein each said heat pipe has a substantially semi-circular configuration.
6. A steering wheel according to Claim 4 or 5, wherein the two heat pipes are thermally connected to one another.
7. A steering wheel according to any preceding Claim, wherein the or each heat pipe is provided with or connected to a heater.

8. A steering wheel according to Claim 7, wherein the or each heat pipe comprises a heating element.
- 5 9. A steering wheel according to any preceding Claim having heat pipes located only in the rim.
- 10 10. A steering wheel substantially as hereinbefore described with reference to and as shown in the accompanying drawings.
- 10 11. Any novel feature or combination of features disclosed herein.

ABSTRACT5 **“IMPROVEMENTS IN OR RELATING TO A STEERING WHEEL”**

10 A steering wheel is disclosed which has a central hub (15) which is connected
by at least one spoke (14) to a rim (13). At least one heat pipe (9) is provided
which is thermally isolated from any external cooling arrangement and is
configured to transfer heat from a first region (5) of the rim (13) to another
region (6) of the rim (13) solely under its own function. The heat pipe (9) is
preferably provided extending around the rim (13).
